## BUSINESS EMPLOYMENT DYNAMICS – SECOND QUARTER 2011

Chart 1. Private sector gross job gains and gross job losses, seasonally adjusted  
March 2001 – June 2011

Source: U.S. Bureau of Labor Statistics

Note: Shaded area represents NBER defined recession period.

From March to June 2011 **gross job gains** from opening and expanding private sector establishments was 6.9 million, an increase of 554,000 jobs as compared to the previous quarter, the U.S. Bureau of Labor Statistics reported today. Over this period, **gross job losses** from closing and contracting private sector establishments was 6.3 million, an increase of 228,000 jobs lost as compared to the previous quarter.

Gross job gains exceeded gross job losses in all three major firm size class categories. (See table 4.)

The change in the number of jobs over time is the net result of increases and decreases in employment that occur at all businesses in the economy. Business Employment Dynamics (BED) statistics track these changes in employment at private business units from the third month of one quarter to the third month of the next. Gross job gains are the sum of increases in employment from expansions at existing units and the addition of new jobs at opening units. Gross job losses are the result of contractions in employment at existing units and the loss of jobs at closing units. The difference between the number of gross job gains and the number of gross job losses is the net change in employment. (See the Technical Note for more information.)

The BED data series include gross job gains and gross job losses at the establishment level by industry subsector and for the 50 states, the District of Columbia, Puerto Rico, and the Virgin Islands, as well as gross job gains and gross job losses at the firm level by employer size class.

### New Business Employment Dynamics (BED) Data Series

With the release of this quarter's data, additional state data at the NAICS industry sector level are now available. These data are accessible through the data query tools at [www.bls.gov/bdm/](http://www.bls.gov/bdm/). Data are available from September 1992 through June 2011 and will be updated quarterly.

Chart 2. Components of private sector gross job gains and gross job losses at expanding and contracting establishments, seasonally adjusted  
March 2001 – June 2011

Job gains at **expanding** establishments totaled 5.6 million in second quarter 2011, an increase from the previous quarter's gain of 5.2 million jobs.

**Opening** establishments accounted for 1.3 million jobs in second quarter 2011, an increase of 157,000 jobs over the previous quarter's gain of 1.1 million.

**Contracting** establishments lost 5.1 million jobs in the second quarter of 2011. This is an increase from the prior quarter when contracting establishments lost 5.0 million jobs.

Chart 3. Components of private sector gross job gains and gross job losses at opening and closing establishments, seasonally adjusted  
March 2001 – June 2011

In the second quarter of 2011, **closing** establishments lost 1.2 million jobs, an increase of 114,000 jobs lost from the previous quarter. (See tables 1 and 3.)

The difference between the number of gross job gains and the number of gross job losses yielded a **net employment change** of 578,000 jobs in the private sector during the second quarter of 2011. (See table 1.)

**Gross job gains** represented 6.4 percent of private sector employment in second quarter 2011, while **gross job losses** represented 5.8 percent of private sector employment. (See table 2.)

In second quarter 2011, the number of **establishment births** (a subset of the openings data, see the Technical Note for more information) rose by 4,000 to 187,000. These new establishments accounted for 727,000 jobs, an increase of 67,000 from the previous quarter.

Data for **establishment deaths** (a subset of the closings data) are available through third quarter 2010, when 695,000 jobs were lost at 189,000 establishments. These figures represent an increase from the second quarter when 652,000 jobs were lost at 185,000 establishments. (See table 8.)

From March to June 2011, gross job gains exceeded gross job losses in all but three **industry sectors** -- utilities, information, and financial activities. The construction industry experienced its first positive net employment change since March 2007. In second quarter 2011, the construction industry added 36,000 jobs with gross job gains of 662,000 and gross job losses of 626,000. The information sector continued to experience net job losses, losing 5,000 jobs in the second quarter 2011. This was the sixteenth consecutive quarter of net losses for the information sector. Education and health services continued to have positive over-the-quarter net gains, adding 26,000 jobs. This figure, however, represents the lowest level of net gains for this sector since the series began in September 1992. (See table 3.)

**Table A. Three-month private sector gross job gains and losses, seasonally adjusted**

Category	3 months ended				
	June 2010	Sept. 2010	Dec. 2010	Mar. 2011	June 2011
	Levels (in thousands)				
Gross job gains.....	6,969	6,685	7,009	6,338	6,892
At expanding establishments.....	5,687	5,427	5,631	5,230	5,627
At opening establishments.....	1,282	1,258	1,378	1,108	1,265
Gross job losses.....	6,248	6,480	6,427	6,086	6,314
At contracting establishments.....	5,086	5,255	5,199	4,969	5,083
At closing establishments.....	1,162	1,225	1,228	1,117	1,231
Net employment change <sup>1</sup> .....	721	205	582	252	578
	Rates (percent)				
Gross job gains.....	6.6	6.3	6.6	5.9	6.4
At expanding establishments.....	5.4	5.1	5.3	4.9	5.2
At opening establishments.....	1.2	1.2	1.3	1.0	1.2
Gross job losses.....	5.9	6.2	6.1	5.7	5.8
At contracting establishments.....	4.8	5.0	4.9	4.7	4.7
At closing establishments.....	1.1	1.2	1.2	1.0	1.1
Net employment change <sup>1</sup> .....	.7	.1	.5	.2	.6

<sup>1</sup>The net employment change is the difference between total gross job gains and total gross job losses. See the Technical Note for further information.

Gross job gains and losses increased in all three major **firm size classes** compared to the previous quarter. Firms with 250 or more employees experienced the largest increase in both gross job gains and gross job losses. This size class comprised 32 percent of the total net change in employment for the quarter. (See tables 4 and 5.)

In the second quarter of 2011, gross job gains exceeded gross job losses in 41 **states** and the District of Columbia. Texas had the largest net employment change of 70,560 jobs, followed by New York with 57,072 jobs. (See table 6.) Alaska experienced the largest rate of net employment change at 1.5 percent, followed by Colorado and New Jersey at 1.0 percent each. (See table 7.)

### More Information

Additional information on gross job gains and gross job losses are available online at [www.bls.gov/bdm](http://www.bls.gov/bdm). This information includes data on the levels and rates of gross job gains and gross job losses by firm size, not seasonally adjusted data and other seasonally adjusted time series not presented in this release, charts of gross job gains and gross job losses by industry and firm size, and frequently asked questions on firm size data. Additional information about the Business Employment Dynamics data can be found in the Technical Note of this release or may be obtained by e-mailing [BDMinfo@bls.gov](mailto:BDMinfo@bls.gov).

**The Business Employment Dynamics for Third Quarter 2011 are scheduled to be released on Tuesday, May 1, 2012 at 10:00 a.m. (EDT).**

## Technical Note

The Business Employment Dynamics (BED) data are a product of a federal-state cooperative program known as Quarterly Census of Employment and Wages (QCEW). The BED data are compiled by the U.S. Bureau of Labor Statistics (BLS) from existing quarterly state unemployment insurance (UI) records. Most employers in the U.S. are required to file quarterly reports on the employment and wages of workers covered by UI laws, and to pay quarterly UI taxes. The quarterly UI reports are sent by the State Employment Security Agencies (SESAs) to BLS and form the basis of the Bureau's establishment universe sampling frame. These reports are also used to produce the quarterly QCEW data on total employment and wages and the longitudinal BED data on gross job gains and losses. Other important Bureau uses of the UI reports are in the Current Employment Statistics (CES) program.

In the BED program, the quarterly UI records are linked across quarters to provide a longitudinal history for each establishment. The linkage process allows the tracking of net employment changes at the

establishment level, which in turn allows the estimation of jobs gained at opening and expanding units and jobs lost at closing and contracting units.

### Differences between QCEW, BED, and CES employment measures

The Bureau publishes three different establishment-based employment measures for any given quarter. Each of these measures – QCEW, BED, and CES – makes use of the quarterly UI employment reports in producing data; however, each measure has a somewhat different universe coverage, estimation procedure, and publication product.

Differences in coverage and estimation methods can result in somewhat different measures of over-the-quarter employment change. It is important to understand program differences and the intended uses of the program products. (See table below.)

Additional information on each program can be obtained from the program web sites shown in the table below.

**Summary of Major Differences between QCEW, BED, and CES Employment Measures**

## Coverage

Employment and wage data for workers covered by state UI and Unemployment Compensation for Federal Employees (UCFE) laws are compiled from quarterly contribution reports submitted to the SESAs by employers. In addition to the quarterly contribution reports, employers who operate multiple establishments within a state complete a questionnaire, called the "Multiple Worksite Report," which provides detailed information on the location of their establishments. These reports are based on place of employment rather than place of residence. UI and UCFE coverage is broad and basically comparable from state to state.

Major exclusions from UI coverage are self-employed workers, religious organizations, most agricultural workers on small farms, all members of the Armed Forces, elected officials in most states, most employees of railroads, some domestic workers, most student workers at schools, and employees of certain small nonprofit organizations.

Gross job gains and gross job losses in this release are derived from longitudinal histories of 6.7 million private sector employer reports out of 9.1 million total reports of employment and wages submitted by states to BLS in the first quarter of 2011. Gross job gains and gross job losses data in this release do not report estimates for government employees or private households (NAICS 814110), and do not include establishments with zero employment in both previous and current quarters. Data from Puerto Rico and the Virgin Islands also are excluded from the national data. As an illustration, the table below shows, in millions of establishments, the number of establishments excluded from the national gross job gains and gross job losses data in the first quarter 2011:

### Number of active establishments included in Business Employment Dynamics data at the national level

	Millions
Total establishments QCEW program .....	9.1
Excluded: Public sector .....	0.3
Private households.....	0.7
Zero employment .....	1.3
Establishments in Puerto Rico and the Virgin Islands.....	0.1
 Total establishments included in Business Employment Dynamics data.....	 6.7

## Unit of analysis

*Establishments* are used in the tabulation of the BED statistics by industry and *firms* are used in the tabulation of the BED size class statistics. An establishment is defined as an economic unit that produces goods or services, usually at a single physical location, and engages in one or predominantly one activity. A firm is a legal business, either corporate or otherwise, and may consist of several establishments. Firm-level data are compiled based on an aggregation of establishments under common ownership by a corporate parent using employer tax identification numbers. The firm level aggregation which is consistent with the role of corporations as the economic decision makers are used for the measurement of the BED data elements by size class.

Because of the difference in the unit of analysis, total gross job gains and gross job losses by size class are lower than total gross job gains and gross job losses by industry, as some establishment gains and losses within a firm are offset during the aggregation process. However, the total net changes in employment are the same for not seasonally adjusted data and are similar for seasonally adjusted data.

## Concepts and methodology

The Business Employment Dynamics data measure the net change in employment at the establishment or firm level. These changes come about in one of four ways. A net increase in employment can come from either opening units or expanding units. A net decrease in employment can come from either closing units or contracting units. Gross job gains include the sum of all jobs added at either opening or expanding units. Gross job losses include the sum of all jobs lost in either closing or contracting units. The net change in employment is the difference between gross job gains and gross job losses.

The formal definitions of employment changes are as follows:

*Openings.* These are either units with positive third month employment for the first time in the current quarter, with no links to the prior quarter, or with positive third month employment in the current quarter following zero employment in the previous quarter.

*Expansions.* These are units with positive employment in the third month in both the previous and current quarters, with a net increase in employment over this period.

*Closings.* These are either units with positive third month employment in the previous quarter, with no employment or zero employment reported in the current quarter.

*Contractions.* These are units with positive employment in the third month in both the previous and current quarters, with a net decrease in employment over this period.

*Births.* These are units with positive third month employment for the first time in the current quarter with no links to the prior quarter, or units with positive third

month employment in the current quarter and zero employment in the third month of the previous four quarters. Births are a subset of openings not including re-openings of seasonal businesses.

*Deaths.* These are units with no employment or zero employment reported in the third month of four consecutive quarters following the last quarter with positive employment. Deaths are a subset of closings not including temporary shutdowns of seasonal businesses. A unit that closes during the quarter may be a death, but we wait three quarters to determine whether it is a permanent closing or a temporary shutdown. Therefore, there is always a lag of three quarters for the publication of death statistics.

All employment changes are measured from the third month of the previous quarter to the third month of the current quarter. Not all establishments and firms change their employment levels. Units with no change in employment count towards estimates of total employment, but not for levels of gross job gains and gross job losses.

Gross job gains and gross job losses are expressed as rates by dividing their levels by the average of employment in the current and previous quarters. This provides a symmetric growth rate. The rates are calculated for the components of gross job gains and gross job losses and then summed to form their respective totals. These rates can be added and subtracted just as their levels can. For instance, the difference between the gross job gains rate and the gross job losses rate is the net growth rate.

### **Establishment Births and Deaths**

For the purpose of BED statistics, *births* are defined as establishments that appear in the longitudinal database for the first time with positive employment in the third month of a quarter, or showed four consecutive quarters of zero employment in the third month followed by a quarter in which it shows positive employment in the third month. Similarly, *deaths* are defined as establishments that either drop out of the longitudinal database or an establishment that had positive employment in the third month of a given quarter followed by four consecutive quarters of showing zero employment in the third month. Although the data for establishment births and deaths are tabulated independently from the data for openings and closings, the concepts are not mutually exclusive. An establishment that is defined as a birth in a given quarter is necessarily an opening as well, and an establishment defined as a death in a quarter must also be a closing. Since openings include seasonal and other re-openings and closings include temporary shutdowns, the net seasonally adjusted values for births and deaths must be less than those for openings and closings. However, because some BED series do not have many re-openings or temporary shutdowns, as well as the fact that births and deaths are independently seasonally adjusted from openings and closings, there may be instances in which

the seasonally adjusted value of the former is greater than the latter.

### **Linkage methodology**

Prior to the measurement of gross job gains and gross job losses, QCEW records are linked across two quarters. The linkage process matches establishments' unique SESA identification numbers (SESA-ID). Between 95 to 97 percent of establishments identified as continuous from quarter to quarter are matched by SESA-ID. The rest are linked in one of three ways. The first method uses predecessor and successor information, identified by the States, which relates records with different SESA-IDs across quarters. Predecessor and successor relations can come about for a variety of reasons, including a change in ownership, a firm restructuring, or a UI account restructuring. If a match cannot be attained in this manner, a probability-based match is used. This match attempts to identify two establishments with different SESA-IDs as continuous. The match is based upon comparisons such as the same name, address, and phone number. Third, an analyst examines unmatched records individually and makes a possible match.

In order to ensure the highest possible quality of data, SESAs verify with employers and update, if necessary, the industry, location, and ownership classification of all establishments on a 4-year cycle. Changes in establishment classification codes resulting from the verification process are introduced with the data reported for the first quarter of the year. Changes resulting from improved employer reporting also are introduced in the first quarter.

### **Sizing methodology**

The method of dynamic sizing is used in calculations for the BED size class data series. Dynamic sizing allocates each firm's employment gain or loss during a quarter to each respective size class in which the change occurred. For example, if a firm grew from 2 employees in quarter 1 to 38 employees in quarter 2, then, of the 36-employee increase, 2 would be allocated to the first size class, 5 to the size class 5 to 9, 10 to size class 10 to 19, and 19 to size class 20 to 49.

Dynamic sizing provides symmetrical firm size estimates and eliminates any systematic effects which may be caused by the transitory and reverting changes in firms' sizes over time. Additionally, it allocates each job gain or loss to the actual size class where it occurred.

### **Annual Data**

The annual gross job gains and gross job losses measure the net change in employment at the establishment level from the third month of a quarter in the previous year to the third month of the same quarter in the current year. The BLS publishes annual BED data based on March-to-March changes once a year with the release of the first quarter BED data. The annual data based on over-the-year changes for other quarters of the year are available upon request. The definitions and

methodology in measuring annual gross job gains and gross job losses are similar to the quarterly measures. The linkage method considers all predecessor and successor relations that may come about due to changes in ownership and corporate restructuring over the entire year. At the establishment level, some of the quarterly job gains and job losses are offset during the estimation over the year. Therefore, the sum of four quarters of gross job gains and gross job losses are *not* equal to annual gross job gains and gross job losses. The net change in employment over the year, however, is equal to the sum of four quarterly net changes on a not seasonally adjusted basis.

### **Seasonal adjustment**

Over the course of a year, the levels of employment and the associated job flows undergo sharp fluctuations due to such seasonal events as changes in the weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. The effect of such seasonal variation can be very large.

Because these seasonal events follow a more or less regular pattern each year, their influence can be eliminated by adjusting these statistics from quarter to quarter. These adjustments make nonseasonal developments, such as declines in economic activity, easier to recognize. For example, the large number of youths taking summer jobs is likely to obscure other changes that have taken place in June relative to March, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. The adjusted figures provide a more useful tool with which to analyze changes in economic activity.

The employment data series for opening, expanding, closing, and contracting units are independently seasonally adjusted; net changes are calculated based on the difference between gross job gains and gross job losses. Similarly, for industry data, the establishment counts data series for opening, expanding, closing, and contracting establishments are independently adjusted, and the net changes are calculated based on the difference between the number of opening and closing establishments. Additionally establishment and employment levels are independently seasonally adjusted to calculate the seasonally adjusted rates. Concurrent seasonal adjustment is run using X-12 ARIMA. Seasonally adjusted data series for total private are the sum of seasonally adjusted data of all sectors including the unclassified sector, which is not separately published.

The net over-the-quarter change derived by summing the BED component series will differ from the net employment change estimated from the seasonally adjusted total private employment series from the CES program. The intended use of BED statistics is to show

the dynamic labor market changes that underlie the net employment change statistic. As such, data users interested particularly in the net employment change and not in the gross job flows underlying this change should refer to CES data for over-the-quarter net employment changes.

### **Reliability of the data**

Since the data series on Business Employment Dynamics are based on administrative rather than sample data, there are no issues related to sampling error. Nonsampling error, however, still exists. Nonsampling errors can occur for many reasons, such as the employer submitting corrected employment data after the end of the quarter or typographical errors made by businesses when providing information. Such errors, however, are likely to be distributed randomly throughout the dataset.

Changes in administrative data sometimes create complications for the linkage process. This can result in overstating openings and closings while understating expansions and contractions. The BLS continues to refine methods for improving the linkage process to alleviate the effects of these complications.

The BED data series are subject to periodic minor changes based on corrections in QCEW records, updates on predecessors and successors information, and seasonal adjustment revisions.

Annual revisions are published each year with the release of the first quarter data. These revisions cover the last four quarters of not seasonally adjusted data and 5 years of seasonally adjusted data.

### **Additional statistics and other information**

Several other programs within BLS produce closely related information. The QCEW program provides both quarterly and annual estimates of employment by state, county, and detailed industry. News releases on quarterly county employment and wages and an annual bulletin: *Employment and Wages Annual Averages*, are available upon request from the Division of Administrative Statistics and Labor Turnover, Bureau of Labor Statistics, U.S. Department of Labor, Washington, DC 20212; telephone 202-691-6567; (<http://www.bls.gov/cew/>); (e-mail: [QCEWInfo@bls.gov](mailto:QCEWInfo@bls.gov)).

The CES program produces monthly estimates of employment, its net change, and earnings by detailed industry. These estimates are part of the Employment Situation report put out monthly by BLS.

The Job Openings and Labor Turnover Survey (JOLTS) program provides monthly measures of job openings, as well as employee hires and separations.

Information in this release will be made available to sensory impaired individuals upon request. Voice phone: 202-691-5200; TDD message referral number: 1-800-877-8339.

**Table 1. Private sector gross job gains and losses, seasonally adjusted**  
(In thousands)

Year	3 months ended	Net change <sup>1</sup>	Gross job gains			Gross job losses		
			Total	Expanding establishments	Opening establishments	Total	Contracting establishments	Closing establishments

<sup>1</sup> Total gross job gains and gross job losses by firm are lower than total gross job gains and gross job losses by establishment, as some establishment gains and losses within a firm are offset during the aggregation process.

<sup>2</sup> Net change is the difference between total gross job gains and total gross job losses.

<sup>3</sup> Net change totals for the firm-level data differ from the establishment-level data due to independent seasonal adjustment.

NOTE: See <http://www.bls.gov/bdm/bdmfirmfirmsize.htm> for more detailed firm size class data

**Table 5. Components of private sector gross job gains and losses by firm size, seasonally adjusted**

<sup>1</sup> Values for deaths are not available for the most recent three quarters. See the Technical Note for more information.

<sup>2</sup> The rates measure births and deaths as a percentage of the average of the previous and current quarter employment levels or total number of establishments
