BUSINESS EMPLOYMENT DYNAMICS: SECOND QUARTER 2006

From March 2006 to June 2006, the number of job gains from opening and expanding private sector establishments was 7.8 million, and the number of job losses from closing and contracting establishments was 7.3 million, according to data released today by the Bureau of Labor Statistics of the U.S. Department of Labor. Gross job gains exceeded gross job losses in all sectors, except construction, utilities, and retail trade. (See charts 1 and 2 and table 3.) Firms with 1,000 or more employees accounted for 18.3 percent of the net gains in employment, representing the largest contribution to employment growth among all firm size classes. (See tables D and 4.)

The Business Employment Dynamics (BED) data series include gross job gains and gross job losses at the establishment level by major industry sector, as well as gross job gains and gross job losses at the firm level by employer size class.

The change in the number of jobs over time is the net result of increases and decreases in employment that occur at all businesses in the economy. BED statistics track these changes in employment at private business units from the third month of one quarter to the third month of the next. Gross job gains are the sum of increases in employment from expansions at existing units and the addition of new jobs at opening units. Gross job losses are the result of contractions in employment at existing units and the loss of jobs at closing units. The difference between the number of gross jobs gained and the number of gross jobs lost is the net change in employment. (See the Technical Note for more information.)

Table A. Three-month private sector gross job gains and losses, seasonally adjusted

Private Sector Establishment-Level Gross Job Gains and Job Losses

Opening and expanding private sector business establishments gained 7.8 million jobs in the second quarter of 2006, an increase of 205,000 from the previous quarter. Over the second quarter, expanding establishments added 6.3 million jobs, while opening establishments added 1.5 million jobs.

Gross job losses totaled 7.3 million, an increase of 523,000 from the previous quarter. During the quarter, contracting establishments lost 5.9 million jobs, while closing establishments lost 1.4 million jobs. (See tables A, 1, 3, and chart 2.)

The difference between the number of gross jobs gained and the number of gross jobs lost yielded a positive net change of 466,000 jobs in the private sector for second quarter 2006.

From March 2006 to June 2006, gross job gains represented 6.9 percent of private sector employment, while gross job losses represented 6.5 percent of private sector employment. (See tables A and 2.) These gross job gain and loss statistics demonstrate that a sizable number of jobs appear and disappear in the relatively short time frame of one quarter.

Major Industry Sector Gross Job Gains and Gross Job Losses

Goods-producing. Expanding and opening establishments in the goods-producing sector accounted for 1,673,000 jobs gained, and contracting and closing establishments accounted for 1,644,000 jobs lost. This net gain of 29,000 jobs was a decline from 168,000 net jobs gained in the previous quarter. (See tables B and 3.)

¹ Includes unclassified sector, not shown separately.

Construction. In construction, gross job gains over the quarter fell to 828,000 and gross job losses increased to 830,000, resulting in a net loss of 2,000 jobs. This is the first quarter of net loss since the second quarter of 2003.

Manufacturing. Gross job gains in manufacturing increased to a level of 559,000 jobs in the second quarter of 2006. Despite an increase in gross job losses, from 528,000 in the first quarter to 549,000 in the current quarter, this sector experienced a positive net change of 10,000 jobs.

Service-providing. In the service-providing sector, gross job gains totaled 6,088,000 and gross job losses totaled 5,651,000 in the second quarter of 2006, resulting in a positive net change of 437,000 jobs.

Retail trade. Gross job gains in the retail trade sector totaled 1,053,000. Gross job losses increased to 1,074,000, resulting in a net loss of 21,000 jobs. This is the first quarter of net employment loss in this sector since September 2004.

Leisure and hospitality. The leisure and hospitality sector gained 1,200,000 jobs and lost 1,169,000 jobs in the second quarter of 2006, for a net gain of 31,000.

Number of Establishments Gaining and Losing Employment

Another way to look at the dynamics of business activity is to monitor the number and proportion of business units that are growing and declining. The second quarter of 2006 represented the twelfth consecutive quarter where the number of expanding establishments exceeded the number of contracting establishments. Out of 6.8 million active private sector establishments, a total of 1,918,000 establishments gained jobs from March 2006 to June 2006. (See table C.) Of these, 1,558,000 were expanding establishments

Table C. Number of private sector establishments by direction of employment change, seasonally adjusted

¹ The net establishment change is the difference between the number of opening establishments and the number of closing establishments. See the Technical Note for further information.

and 360,000 were opening establishments. During the quarter, 1,543,000 establishments contracted and 341,000 establishments closed, resulting in 1,884,000 establishments losing jobs. Overall, the number of active private sector establishments increased by 19,000 during the quarter. This change is the difference between the number of opening establishments and the number of closing establishments.

Firm-level Gross Job Gains and Gross Job Losses by Size Class

From March 2006 to June 2006, firms with 1,000 or more employees accounted for 18.3 percent of the net gains in employment, representing the largest contribution to employment growth among all firm size classes. This size class had the largest share of gross job gains (16.7 percent) and the largest share of gross job losses (16.6 percent). (See tables D and 4 and charts 3 and 4.) Firms with 1 to 4 employees had the smallest contribution to the total net change in employment of 2.1 percent from March 2006 to June 2006, a decrease from the previous quarter's contribution of 5.8 percent.

In the second quarter of 2006, firms with 500 or more employees represented 29.1 percent of the total net change in employment, 21.5 percent of gross job gains, and 21.0 percent of gross job losses. (See table D.) Historically, from September 1992 through March 2006, firms with 500 or more employees have accounted for, on average, 34.6 percent of quarterly net employment growth. (See table E.)

Firms with 1 to 4 employees continued to have the largest shares of both job gains at opening firms and job losses at closing firms, with 57.5 percent and 57.8 percent respectively, in the second quarter of 2006. (See table 4.)

More Information

Additional information on gross job gains and gross job losses are available at the Business Employment Dynamics Web page on the BLS Web site at http://www.bls.gov/bdm. This information includes data on the levels and rates of gross job gains and gross job losses by firm size, the not seasonally adjusted data and other seasonally adjusted time series not presented in this release, charts of gross job gains and gross job losses by industry and size class, and frequently asked questions on size-class data. Additional information about the Business Employment Dynamics data can be found in the Technical Note of this release or may be obtained by e-mailing BDMinfo@bls.gov.

Comparing Business Employment Dynamics Data with Current Employment Statistics and Quarterly Census of Employment and Wages Data

The net change in employment from Business Employment Dynamics (BED) data series will not match the net change in employment from the monthly Current Employment Statistics (CES) survey. The CES estimates are based on monthly surveys from a sample of establishments, while gross job gains and gross job losses are based on a quarterly census of administrative records. In addition, the CES has a different coverage, excluding the agriculture sector but including establishments not covered by the unemployment insurance program. The net over-the-quarter changes derived by aggregating component series in the BED data may be different from the net employment change estimated from the CES seasonally adjusted total employment series. The intended use of the BED statistics is to show the dynamic labor market flows that underlie the net changes in aggregate employment levels; data users who want to track net changes in aggregate employment levels over time should refer to CES data.

BED data have a more limited scope than the Quarterly Census of Employment and Wages (QCEW) data. The data in this release, in contrast to the QCEW data, exclude government employees, private households (NAICS 814110), and establishments with zero employment.

See the Technical Note for further information.

Technical Note

The Business Employment Dynamics (BED) data are a product of a federal-state cooperative program known as Quarterly Census of Employment and Wages (QCEW), or the ES-202 program. The BED data are compiled by the U.S. Bureau of Labor Statistics (BLS) from existing quarterly state unemployment insurance (UI) records. Most employers in the U.S. are required to file quarterly reports on the employment and wages of workers covered by UI laws, and to pay quarterly UI taxes. The quarterly UI reports are sent by the State Workforce Agencies (SWAs) to BLS and form the basis of the Bureau's establishment universe sampling frame. These reports also are used to produce the quarterly QCEW data on total employment and wages and the longitudinal BED data on gross job gains and losses. Other important BLS uses of the UI reports are in the Current Employment Statistics (CES)

program. (See table below for differences between QCEW, CES, and BED.)

In the BED program, the quarterly UI records are linked across quarters to provide a longitudinal history for each establishment. The linkage process allows the tracking of net employment changes at the establishment level, which in turn allows the estimation of jobs gained at opening and expanding establishments and jobs lost at closing and contracting establishments.

Differences between QCEW, BED, and CES employment measures

The BLS publishes three different establishment-based employment measures for any given quarter. Each of these measures—QCEW, BED, and CES—makes use of the quarterly

Summary of Major Differences between QCEW, BED, and CES Employment Measures

	QCEW	BED	CES
Source	Count of UI administrative records submitted by 8.8 million establish- ments	Count of longitudinally-linked UI administrative records submitted by 6.8 million private sector employers	• Sample survey: 400,000 establishments
Coverage	UI and UCFE coverage, including all employers subject to state and federal UI laws	UI coverage, excluding government, private households, and establishments with zero employment	Nonfarm wage and salary jobs: • UI coverage, excluding agriculture, private households, and self-employed workers • Other employment, including rail-roads, religious organizations, and other non-UI-covered jobs
Publication frequency	Quarterly 7 months after the end of each quarter	• Quarterly - 8 months after the end of each quarter	Monthly Usually first Friday of following month
Use of UI file	Directly summarizes and publishes each new quarter of UI data	•Links each new UI quarter to longitudinal database and directly summarizes gross job gains and losses	• Uses UI file as a sampling frame and annually realigns (benchmarks) sample estimates to first quarter UI levels
Principal products	Provides a quarterly and annual universe count of establishments, employment, and wages at the county, MSA, state, and national levels by detailed industry	 Provides quarterly employer dynamics data on establishment openings, closings, expansions, and contractions at the national level by NAICS supersectors and by size of firm Future expansions will include data at the county, MSA, and state level 	Provides current monthly estimates of employment, hours, and earnings at the MSA, state, and national level by industry
Principal uses	Major uses include: Detailed locality data Periodic universe counts for benchmarking sample survey estimates Sample frame for BLS establishment surveys	Major uses include: Business cycle analysis Analysis of employer dynamics underlying economic expansions and contractions An analysis of employment expansion and contractions by size of firm	Major uses include: Principal national economic indicator Official time series for employment change measures Input into other major economic indicators
Program Web sites	• www.bls.gov/cew/	• www.bls.gov/bdm/	• www.bls.gov/ces/

UI employment reports in producing data; however, each measure has a somewhat different universe coverage, estimation procedure, and publication product.

Differences in coverage and estimation methods can result in somewhat different measures of over-the-quarter employment change. It is important to understand program differences and the intended uses of the program products. (See table on previous page.) Additional information on each program can be obtained from the program Web sites shown in the table.

Coverage

Employment and wage data for workers covered by state UI and Unemployment Compensation for Federal Employees (UCFE) laws are compiled from quarterly contribution reports submitted to the SWAs by employers. In addition to the quarterly contribution reports, employers who operate multiple establishments within a state complete a questionnaire, called the "Multiple Worksite Report," which provides detailed information on the location of their establishments. These reports are based on place of employment rather than place of residence. UI and UCFE coverage is broad and basically comparable from state to state.

Major exclusions from UI coverage are self-employed workers, religious organizations, most agricultural workers on small farms, all members of the Armed Forces, elected officials in most states, most employees of railroads, some domestic workers, most student workers at schools, and employees of certain small nonprofit organizations.

Gross job gains and gross job losses in this release are derived from longitudinal histories of over 6.8 million private sector employer reports out of 8.8 million total reports of employment and wages submitted by states to BLS in the first quarter of 2006. Gross job gains and gross job losses data in this release do not report estimates for government employees or private households (NAICS 814110), and do not include establishments with zero employment over three quarters. Data from Puerto Rico and the Virgin Islands also are excluded from the national data. As an illustration, the table below shows, in millions of establishments, the number of establishments excluded from the gross job gains and gross job losses data in the second quarter of 2006:

Number of active establishments included in Business Employment Dynamics data

	Millions							
Total establishments QCEW program 8.8								
Excluded:	Public sector 0.3							
	Private households 0.6							
	Zero employment 1.0							
	Establishments in Puerto Rico							
	and the Virgin Islands 0.1							
Total establish	nments included in Business							
Employmen	t Dynamics data 6.8							

Unit of analysis

Establishments are used in the tabulation of the BED statistics by industry and *firms* are used in the tabulation of the BED size-class statistics. An establishment is defined as an economic unit that produces goods or services, usually at a single physical location, and engages in one or predominantly one activity. A firm is a legal business, either corporate or otherwise, and may consist of several establishments. Firmlevel data are compiled based on an aggregation of establishments under common ownership by a corporate parent using employer tax identification numbers. The firmlevel aggregation, which is consistent with the role of corporations as the economic decision makers, is used for the measurement of the BED data elements by size class.

Because of the difference in the unit of analysis, total gross job gains and gross job losses by size class are lower than total gross job gains and gross job losses by industry, as some establishment gains and losses within a firm are offset during the aggregation process. However, the total net changes in employment are the same for not seasonally adjusted data and are similar for seasonally adjusted data.

Concepts and methodology

The Business Employment Dynamics data measure the net change in employment at the establishment or firm level. These changes come about in one of four ways. A net increase in employment can come from either *opening units* or *expanding units*. A net decrease in employment can come from either *closing units or contracting units. Gross job gains* include the sum of all jobs added at either opening or expanding units. *Gross job losses* include the sum of all jobs lost in either closing or contracting units. The net change in employment is the difference between gross job gains and gross job losses.

The formal definitions of employment changes are as follows:

Openings. These are either units with positive third-month employment for the first time in the current quarter, with no links to the prior quarter, or with positive third-month employment in the current quarter following zero employment in the previous quarter.

Expansions. These are units with positive employment in the third month in both the previous and current quarters, with a net increase in employment over this period.

Closings. These are units with positive third-month employment in the previous quarter, with no employment or zero employment reported in the current quarter.

Contractions. These are units with positive employment in the third month in both the previous and current quarters, with a net decrease in employment over this period.

All establishment-level employment changes are measured from the third month of each quarter. Not all establishments and firms change their employment levels. Units with no change in employment count towards estimates of total employment, but not for levels of gross job gains and gross job losses.

Gross job gains and gross job losses are expressed as rates by dividing their levels by the average of employment in the current and previous quarters. This provides a symmetric growth rate. The rates are calculated for the components of gross job gains and gross job losses and then summed to form their respective totals. These rates can be added and subtracted just as their levels can. For instance, the difference between the gross job gains rate and the gross job losses rate is the net growth rate.

Linkage methodology

Prior to the measurement of gross job gains and gross job losses, QCEW records are linked across two quarters. The linkage process matches establishments' unique SWA identification numbers (SWA-ID). Between 95 to 97 percent of establishments identified as continuous from quarter to quarter are matched by SWA-ID. The rest are linked in one of three ways. The first method uses predecessor and successor information, identified by the states, which relates records with different SWA-IDs across quarters. Predecessor and successor relations can come about for a variety of reasons, including a change in ownership, a firm restructuring, or a UI account restructuring. If a match cannot be attained in this manner, a probability-based match is used. This match attempts to identify two establishments with different SWA-IDs as continuous. The match is based upon comparisons such as the same name, address, and phone number. Third, an analyst examines unmatched records individually and makes a possible match.

In order to ensure the highest possible quality of data, SWAs verify with employers and update, if necessary, the industry, location, and ownership classification of all establishments on a 3-year cycle. Changes in establishment classification codes resulting from the verification process are introduced with the data reported for the first quarter of the year. Changes resulting from improved employer reporting also are introduced in the first quarter.

Sizing methodology

The method of dynamic sizing is used in calculations for the BED size-class data series. Dynamic sizing allocates each firm's employment gain or loss during a quarter to each respective size class in which the change occurred. For example, if a firm grew from 2 employees in quarter 1 to 38 employees in quarter 2, then, of the 36-employee increase, 2 would be allocated to the first size class, 5 to the size class 5 to 9, 10 to size class 10 to 19, and 19 to size class 20 to 49.

Dynamic sizing provides symmetrical firm-size estimates and eliminates any systematic effects which may be caused by the transitory and reverting changes in firms' sizes over time. Additionally, it allocates each job gain or loss to the actual size class where it occurred.

Seasonal adjustment

Over the course of a year, the levels of employment and the associated job flows undergo sharp fluctuations due to such seasonal events as changes in the weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. The effect of such seasonal variation can be very large.

Because these seasonal events follow a more or less regular pattern each year, their influence can be eliminated by adjusting these statistics from quarter to quarter. These adjustments make nonseasonal developments, such as declines in economic activity, easier to recognize. For example, the large number of youths taking summer jobs is likely to obscure other changes that have taken place in June relative to March, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. The adjusted figures provide a more useful tool with which to analyze changes in economic activity.

The employment data series for opening, expanding, closing, and contracting units are independently seasonally adjusted; net changes are calculated based on the difference between gross job gains and gross job losses. Similarly, for industry data, the establishment counts data series for opening, expanding, closing, and contracting establishments are independently adjusted, and the net changes are calculated based on the difference between the number of opening and closing establishments. Additionally, establishment and employment levels are independently seasonally adjusted to calculate the seasonally adjusted rates. Concurrent seasonal adjustment is run using X-12 ARIMA. Seasonally adjusted data series for the total private sector are calculated by summing the seasonally adjusted data for all sectors, including the unclassified sector, which is not published separately.

The net over-the-quarter change derived by summing the BED component series will differ from the net employment change estimated from the seasonally adjusted total private employment series from the CES program. The intended use of BED statistics is to show the dynamic labor market changes that underlie the net employment change statistic. As such, data users interested particularly in the net employment change and not in the gross job flows underlying this change should refer to CES data for over-the-quarter net employment changes.

Reliability of the data

Since the data series on Business Employment Dynamics are based on administrative rather than sample data, there are no issues related to sampling error. Nonsampling error, however, still exists. Nonsampling errors can occur for many

reasons, such as the employer submitting corrected employment data after the end of the quarter or typographical errors made by businesses when providing information. Such errors, however, are likely to be distributed randomly throughout the dataset.

Changes in administrative data sometimes create complications for the linkage process. This can result in overstating openings and closings while understating expansions and contractions. The BLS continues to refine methods for improving the linkage process to alleviate the effects of these complications.

The BED data series are subject to periodic minor changes based on corrections in QCEW records, updates on predecessors and successors information, and seasonal adjustment revisions.

Additional statistics and other information

Several other programs within BLS produce closely related information. The QCEW program, also known as the ES-202

program, provides both quarterly and annual estimates of employment by state, county, and detailed industry. News releases on quarterly county employment and wages are available upon request from the Division of Administrative Statistics and Labor Turnover, Bureau of Labor Statistics, U.S. Department of Labor, Washington, DC 20212; telephone 202-691-6567; (http://www.bls.gov/cew/); (e-mail: QCEWInfo@bls.gov).

The CES program produces monthly estimates of employment, its net change, and earnings by detailed industry. These estimates are part of the Employment Situation report put out monthly by BLS.

The Job Openings and Labor Turnover Survey (JOLTS) program provides monthly measures of job openings, as well as employee hires and separations.

Information in this release will be made available to sensory impaired individuals upon request. Voice phone: 202-691-5200; TDD message referral number: 1-800-877-8339.
